Assignment 3 · Evidence file

Kniazev Daniil · AIB-2602 · Business Administration · Company A: Carrefour · Company B: Magnum Cash&Carry

Contents

1. Evidence Folder: running IEEE list [1]–[30], current to Week 7 (this section)
2. Week 6 artifact: human-only versus AI-supported marketing comparison
3. Week 7 artifact: AI/data workflow and governance risk register
4. Data evidence: the 51-product Пайда list (15–21 Oct 2026) and page screenshots

The AI-use declaration is submitted as a separate file.

WEEK 6. MARKETING COMPARISON

Student: Kniazev Daniil Group: AIB-2602 Company B: Magnum Cash&Carry (Company A: Carrefour)

Goal: compare the SAME marketing task performed by a human-only approach and an AI-supported approach. Use documented facts where available; clearly label any hypothetical workflow or predicted KPI.

A. Customer and marketing context

Customer segment (who, needs, evidence/source):
Who: budget-conscious households in Kazakhstan's cities that do a weekly grocery and household shop at Magnum; many are Magnum Club members (Magnum reports more than 2 million) [24]. Needs: keep the weekly basket affordable while annual inflation was 9.8% in August 2026 [4], and see quickly which deals matter and where to buy them.

Evidence: Magnum aims its weekly "Пайда" discounts at goods "for the family and home" [23]. The member count is Magnum's own figure; shopper needs are inferred from public sources, not surveyed.

Product/service and value proposition:
Service: "Magnum Пайда", Magnum's weekly discount programme. For 15–21 October 2026 it listed 51 discounted products, with discounts from 18% to 53% [23].

Value proposition: real weekly savings on everyday family goods, plus Magnum Club bonuses from 0.25% of each receipt [24], bought in a nearby store or delivered by Magnum Go, free from 6,000 ₸ [25].

Customer journey: Awareness → Consideration → Purchase → Experience → Retention. Identify one friction point:
Awareness: weekly Пайда banner on magnum.kz [23]. Consideration: the shopper compares old and new prices. Purchase: in a Magnum store or through Magnum Go delivery [25].

Experience: in-store shopping; Magnum offers a barcode price checker because shelf labels are sometimes not updated in time [24]. Retention: Magnum Club bonuses, coupons and promo codes [24].

Friction point (Consideration → Purchase): the Пайда page tells shoppers to "just keep following Пайда" but gives no store link, Magnum Go link or button, and its "up to 60%" claim was not met that week (maximum 53%) [23].

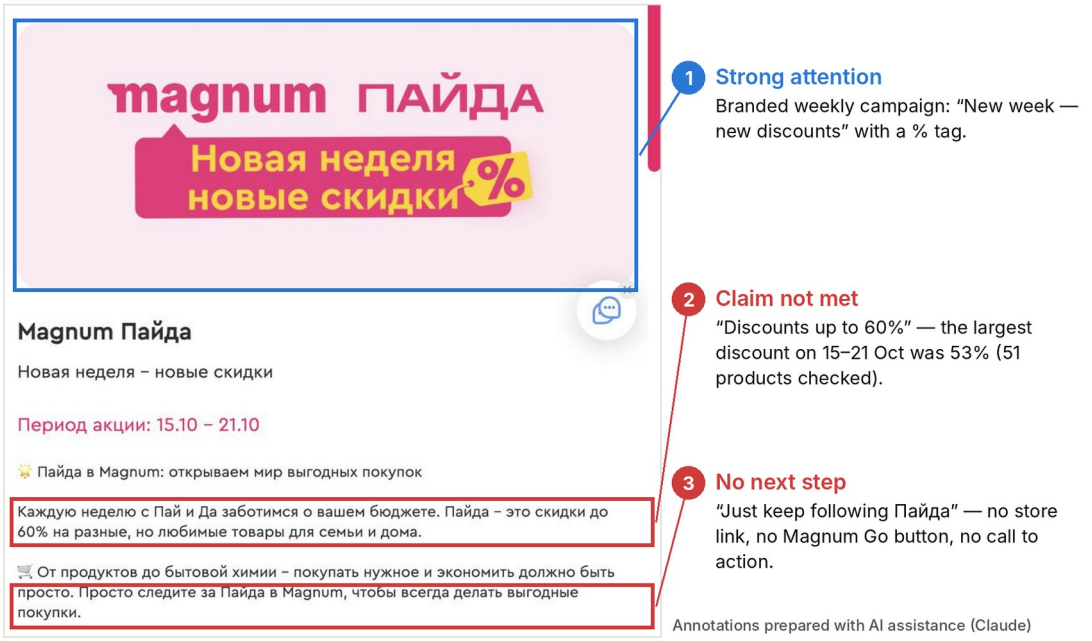

Figure 1. Friction point on the Пайда page: strong attention, a claim not met that week and no next step (screenshot by the author, 16 Oct 2026 [23]; annotations prepared with AI assistance).

B. Same task, two approaches

Specific marketing task (e.g., draft a customer email; select audience; analyse feedback):
Write the weekly Пайда message for Magnum Club members (app push or banner text) that turns interest in the deals into a store visit or a Magnum Go order.

Criterion	Human-only	AI-supported
Inputs / data	Weekly promo list from category managers; brand guidelines.	The same promo list (product, prices, dates) and a written brief. No customer personal data.
Steps and responsible actor	Copywriter selects deals and writes the copy; translator prepares the Kazakh version; brand manager approves.	AI drafts options from the list; copywriter selects and edits; a native speaker checks the Kazakh version; brand manager approves.
Time / resources	Hypothetical: copywriting and translation every week. Magnum publishes no time data.	Hypothetical: drafting takes minutes; staff time moves to checking facts and tone. Needs an approved AI tool.
Expected quality	Native brand voice and Kazakh text. Observed risk: generic copy with no next step [23].	More options and a required call to action. Risks: wrong prices or dates, unnatural Kazakh text.
Privacy / bias risks	Low privacy risk; deal choice depends on personal judgement.	Personalising with Magnum Club purchase data would fall under the Personal Data Law [7], [15]. The tool may favour the deepest discounts over what families need.
Human review and approval	Brand manager approves before publishing.	Every price, date and claim checked against the catalogue; AI never publishes; brand manager gives final approval [16].

Use the rows above for: inputs/data; steps and responsible actor; time/resources; expected quality; privacy/bias risks; human review and approval.

C. Method and result

Comparison method: what input, prompt/instructions, sample or evaluation criteria did you use?
Input: the real Пайда list for 15–21 October 2026 (51 products, magnum.kz, saved 17 October) [23]. Human-only baseline: Magnum's published Пайда headline and text for the same week. Magnum does not say how it was written, so we treat it as the current human process (assumption).

AI-supported: Claude (Anthropic), 17 October 2026. Prompt: "From this week's Пайда list choose ONE deal most useful for a family weekly shop and write a Russian push notification of up to 160 characters with the product, new and old price, the end date 21.10 and one clear next step (nearest Magnum or Magnum Go). Use only facts from the list." Criteria: (1) prices and dates match the catalogue; (2) one concrete offer; (3) a clear next step; (4) every claim is true for that week.

Observed result or reasoned expectation (do not invent measured figures):
Baseline: dates correct; no concrete offer; no next step; "up to 60%" not met (maximum 53%): 1 of 4 criteria. AI draft: "Пайда до 21.10: гель для стирки Persil 2,1 л — 5 499 ₸ вместо 11 599 ₸. Загляните в ближайший Magnum или закажите в Magnum Go." (126 characters). Prices and date match the catalogue (checked 17 October); offer and next step present: 4 of 4.

Limits: one week, one message, scored against the four criteria only; no customer response was measured. The draft mentions Magnum Go, but the Пайда page does not say whether these prices apply in Magnum Go, so a person must confirm this before sending. The AI chose laundry gel (the largest saving, 6,100 ₸) rather than a food item, a choice a marketer should review.

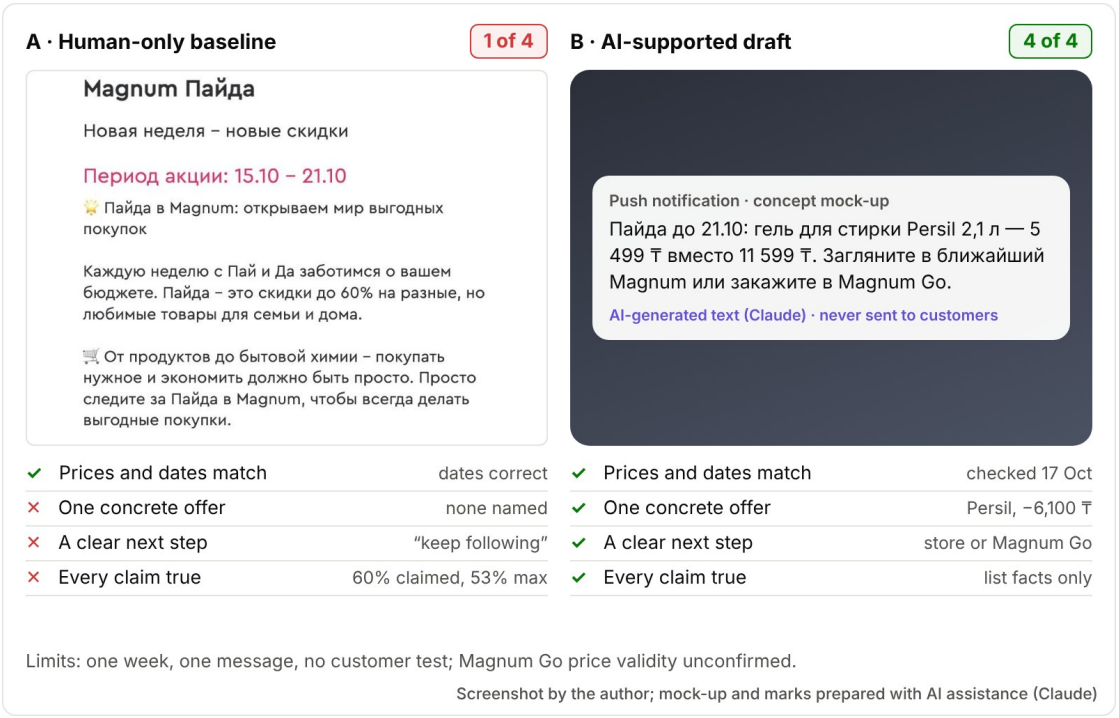

Figure 2. Same task, two outputs: Magnum's published text (screenshot by the author, 17 Oct 2026 [23]) versus the AI-supported draft (Claude; concept mock-up, never sent), scored on the four criteria.

Which approach better serves the customer? What trade-off remains?
AI-supported with mandatory human review serves the customer better: the message names a real saving, an end date and where to buy, which addresses the friction point. People still decide what matters to families, check facts and approve.

Trade-off: faster, more specific drafts versus the risk of wrong prices, unconfirmed claims (Magnum Go) and weak Kazakh text; time saved on writing moves to verification. Proposed pilot KPIs (not results): push

open rate, Magnum Go orders with Пайда items, and 100% of messages passing the fact check before sending.

D. Company A → Company B transfer

Documented comparator practice + source; verdict (ADOPT / ADAPT / PILOT / DELAY / REJECT) and why:
Comparator practice: Carrefour uses generative AI to create marketing content from product data: AI-enriched descriptions on more than 2,000 Carrefour-brand product sheets, to be extended to all sheets [12]. It also offers AI-assisted shopping: the Hopla assistant (2023), still live on carrefour.fr with a notice asking users not to enter personal data [29], and, since 26 March 2026, shopping inside ChatGPT [19]. The releases do not describe human review.

Verdict: ADAPT. Magnum can use AI to draft weekly Пайда copy from its own catalogue data, but must add what Carrefour's releases do not show: a human check of every price, date and claim, native Kazakh review, and no personal data in the tool [7], [16].

Why not ADOPT: Magnum writes in Kazakh and Russian and its offers change weekly, so an error would reach many members quickly. The ChatGPT shopping channel is DELAY: it needs catalogue and checkout integration that this record has not assessed. Next step: a four-week pilot comparing AI-supported and current messages on the criteria above.

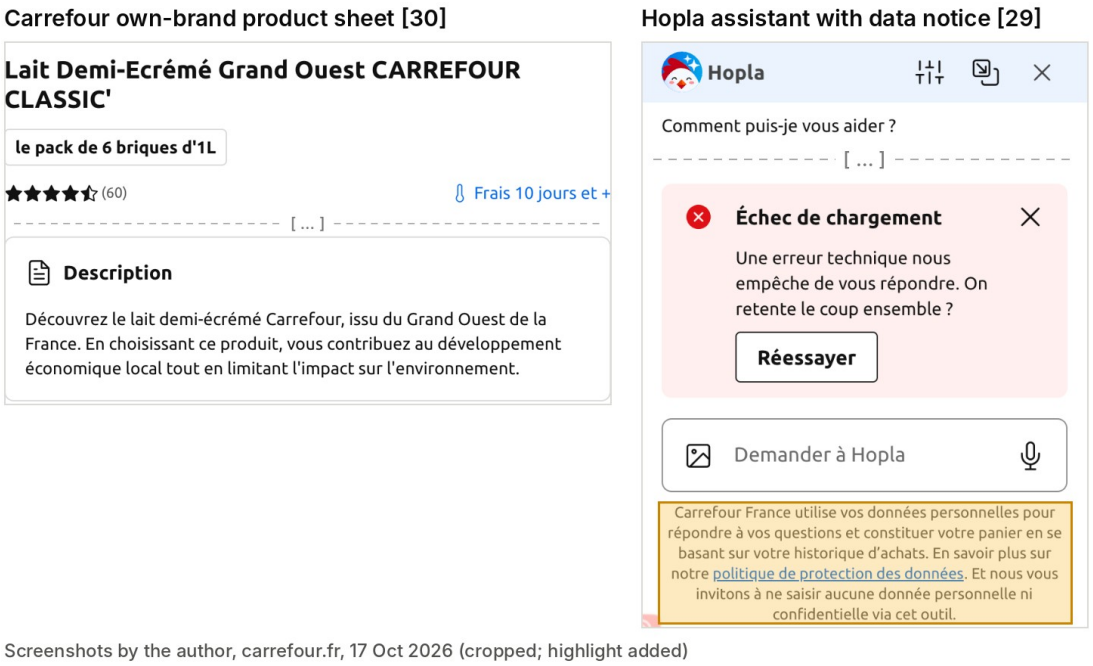

Figure 3. Comparator practice on carrefour.fr: an own-brand product sheet of the type Carrefour says it enriches with AI [12], [30], and the Hopla assistant with its personal-data notice [29] (screenshots by the author, 17 Oct 2026; whether this particular sheet was AI-written is not stated).

Evidence Folder: screenshots of the Пайда page (16–17 Oct 2026) and of carrefour.fr (17 Oct 2026); the 51-product Пайда list (saved 17 Oct 2026; full table in section 4 of the Evidence file); AI prompt and output (Section C). URLs for [4]–[19] are in the Evidence Folder.

AI use: Claude (Anthropic), 17 Oct 2026, generated the AI-supported draft in Section C, prepared the annotations and layout of Figures 1–3 and helped draft this record from the cited sources. Screenshots were taken by the author. Facts were checked against those sources; the student is responsible for the final text.

WEEK 7. AI/DATA WORKFLOW & RISK REGISTER

Student: Kniazev Daniil Group: AIB-2602 Company B: Magnum Cash&Carry

Goal: show how information supports a business decision and how Company B governs the workflow. Use the Week 6 customer/marketing use case where possible.

A. Business decision and systems

Decision/use case; who benefits; what system(s) are involved (e.g., CRM, MIS, analytics):
Decision (continuing the Week 6 use case): each week, which Пайда deal to feature and which message to send to which Magnum Club segment. Members benefit from one relevant, accurate offer; Magnum turns awareness of its deals into store visits or Magnum Go orders [23], [25].

Systems: the pricing and promotion system (transaction processing), the Magnum Club CRM and app (members, consent, notifications), Magnum Go (orders), an approved generative-AI tool (drafts) and a reporting dashboard (management information) [1]. Magnum's internal system names are not public; roles are assumed.

Data vs information: what raw data enters, what useful information is produced?
Raw data: product names, promo and regular prices, validity dates and stock from the pricing system; member IDs, consent flags and purchase categories in the CRM; opens, opt-outs and Magnum Go orders after sending.

Information: a verified weekly message (which deal saves families the most, for which segment, until when and where to buy) and a weekly report showing whether messages led to visits or orders and where errors occurred.

B. Workflow map

Draw or insert your diagram here: DATA SOURCE → COLLECTION / ACCESS → PROCESSING / AI ANALYSIS → HUMAN VERIFICATION → BUSINESS DECISION → CUSTOMER ACTION → MONITORING

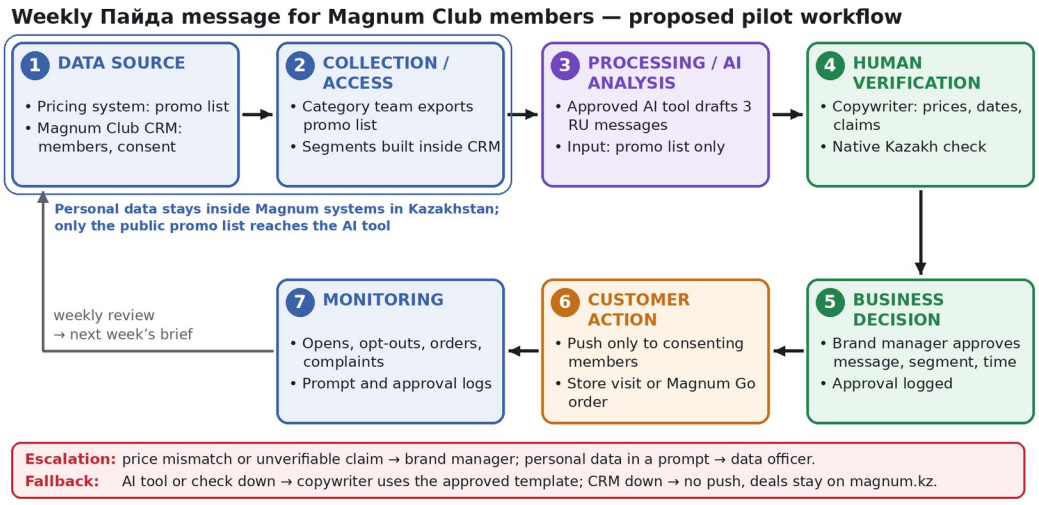

Figure 1. Proposed pilot workflow, not a description of Magnum's current systems (diagram prepared with AI assistance).

For each stage: actor/system, inputs/outputs, permissions and data movement:
1–2 Data source and access: the category team exports the weekly Пайда list (product, prices, dates) from the pricing system; the CRM team builds segments inside Magnum Club using consent flags. Only the public promo list leaves these systems; member data stays in the CRM in Kazakhstan [7], [15].

3–4 AI analysis and verification: the copywriter sends the promo list and a brief to the approved AI tool, which returns three Russian drafts; a native speaker writes or checks the Kazakh version; a script compares every price and date in the draft with the export and blocks mismatches.

5–7 Decision, action and monitoring: the brand manager approves one message per segment; the CRM sends it only to members with marketing consent; the dashboard tracks opens, opt-outs, Magnum Go orders with Пайда items and price complaints; logs keep prompts, drafts and approvals.

Human review: who approves what, and using which criteria?
Copywriter: every price, date and claim must match the catalogue export, and claims such as “up to X%” must be true that week (the 15–21 Oct page promised 60% while the maximum was 53% [23]). Native speaker: meaning and tone of the Kazakh text.

Brand manager: final approval of message, segment and send time against brand rules, the AI-use notice and no manipulative pressure such as false urgency [27]. The approver’s name and time are logged [16].

Escalation for uncertain/high-risk cases; manual fallback for outages:
Escalate to the brand manager when prices differ, a claim cannot be verified or the deal concerns sensitive goods (e.g., baby food); to the person responsible for personal data if member data appears in a prompt or a member complains about data use; to legal if AI labelling under the AI Law is unclear [7], [27].

Manual fallback: if the AI tool or the price check fails, the copywriter writes the message from an approved template using the catalogue export, with the same checks and approval. If the CRM is down, no push is sent and deals stay on magnum.kz [23]. Restart only after the brand manager confirms the fix.

C. Governance risk register — at least two substantive risks

Risk and affected data	Likelihood / impact	Control + owner	Monitoring / evidence
Privacy: member phone numbers or purchase history pasted into an external AI tool, or stored and transferred abroad. Data: Magnum Club personal data.	Medium / High: more than 2 million members [24]; consent, storage in Kazakhstan and cross-border rules apply (Law 94-V, arts. 7, 12, 16) [7].	Only the public promo list goes to AI; segments are built inside the CRM with consent flags; tool contract bans training on inputs. Owner: person responsible for personal data.	Monthly audit of prompt logs (target: no personal data); consent records; incident log.
Reliability: the AI draft states a wrong price or date, or an untrue claim. Data: weekly promo list.	Medium / Medium: misleads customers, causes complaints and damages trust.	Automated price and date match against the export plus copywriter sign-off; no send on mismatch. Owner: brand manager.	Messages passing the check before sending (target 100%); price complaints per campaign.
Bias: AI favours the deepest discounts or supplier-funded brands over family staples; Kazakh-speaking members get weaker copy. Data: promo list, segment rules.	Medium / Medium: less useful offers and unequal service by language.	At least one food staple per week; Russian and Kazakh versions with native review; quarterly review of segment rules. Owner: CRM manager.	Share of food vs non-food hero deals; open and opt-out rates by language.

Accountability and security: no record of who approved an error; AI tool outage or account misuse. Data: drafts, approvals, access credentials.	Low / High: errors cannot be traced or fixed quickly.	Approved enterprise tool with role-based access; approval log names the approver; manual template fallback. Owner: head of marketing with the IT security lead [16].	Access-log reviews; complete approval log (target 100%); quarterly fallback drill; risks reviewed at least yearly [27].

Consider privacy, security, bias, reliability, accountability, escalation and fallback. Do not list a risk without an actionable control. Likelihood and impact are our qualitative assessment for the proposed pilot; targets are proposals.

D. Governance decision and transfer

Which risk matters most for Company B and why? What is the residual risk?
Privacy matters most. The workflow touches the data of Magnum Club members (more than 2 million [24]). Kazakhstan requires consent, storage in Kazakhstan and safeguards for cross-border transfer [7], and the AI Law prohibits processing personal data in breach of that law [27]. A leak cannot be undone, whereas a wrong price can be corrected.

Residual risk: segmentation still processes personal data inside the CRM, people can miss errors during checks, and it is unclear whether AI-drafted, human-edited copy must carry an AI label under art. 21 of the AI Law [27]. Legal review should settle this before the pilot.

Company A practice + verified source; transfer verdict and Kazakhstan-specific justification:
Company A practice: Carrefour personalises its Hopla+ assistant with purchase history [19]. In 2020 the CNIL fined Carrefour France €2.25 million, partly for keeping data on 28 million inactive loyalty customers for 5–10 years and ignoring objections to marketing; Carrefour deleted outdated data, rewrote its notices and committed resources to answer requests within a month [26].

Verdict: ADAPT. Magnum should put these controls (retention limits, clear notices, fast opt-out) in place before any personalisation, adjusted for Kazakhstan: consent and storage in Kazakhstan under Law 94-V [7], an AI-use notice and no manipulative techniques under AI Law No. 230-VIII [27], and Kazakh-language review. Personalisation with purchase history: DELAY until these controls are working.

Carrefour integrates OpenAI technologies and launches a generative AI-powered shopping experience

Carrefour is deploying three innovative tech solutions based around ChatGPT technology: an advice robot for shopping on carrefour.fr, description sheets for Carrefour brand products on its website and support for purchasing procedures. These solutions are based on OpenAI technologies, particularly GPT-4.

Communiqué de presse
Massy, le 26 mars 2026

Carrefour devient le premier retailer européen à proposer de faire ses courses sur ChatGPT

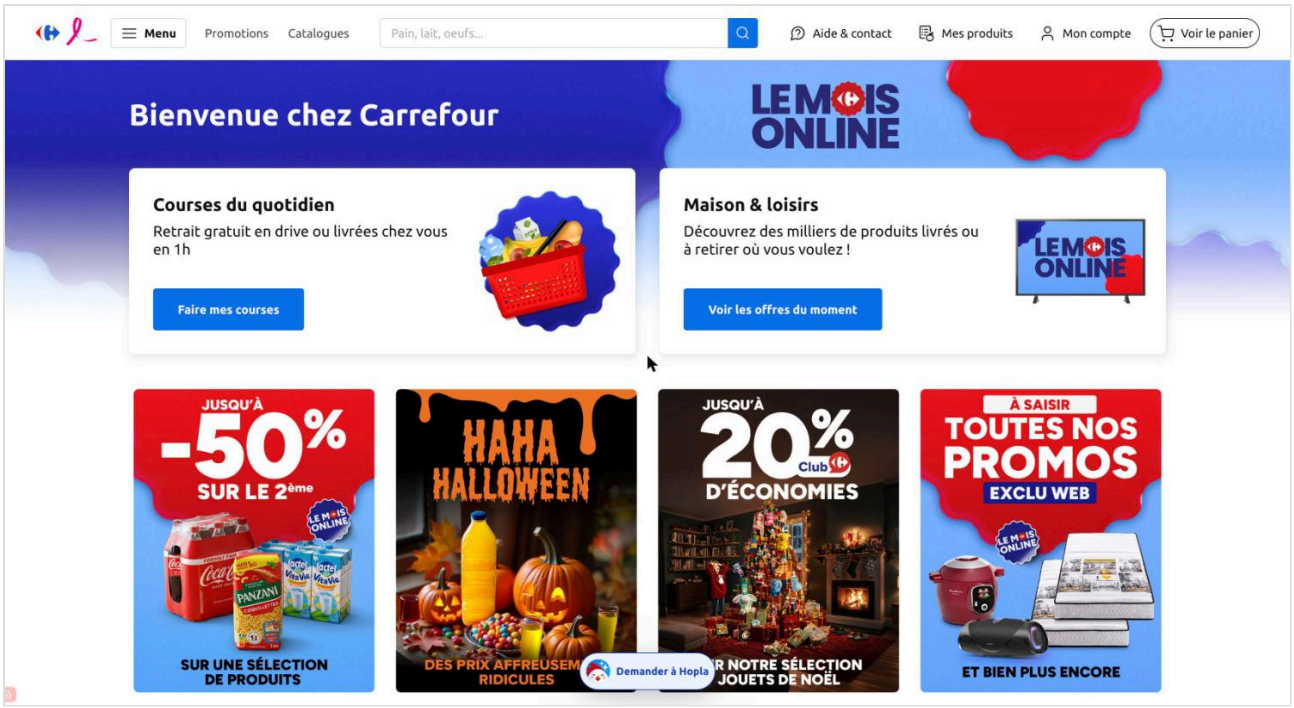

[...]

L'enseigne a pris très tôt le virage de l'IA : en 2023, Carrefour avait lancé sur son site de e-commerce Hopla un chatbot conversationnel pensé pour générer des paniers de courses en fonction de contraintes alimentaires ou d'un budget ; en 2025 Hopla+ a remplacé Hopla qui propose des paniers de courses selon l'historique d'achat des clients. Début 2026, Carrefour a conforté sa position en soutenant le Universal Commerce Protocol de Google, un standard ouvert dédié au commerce agentique, permettant aux agents IA et aux systèmes des retailers de communiquer de manière fluide et transparente.
